PENTAIR

POWERE PLUS 2000 PLUNGER PUMPS

HYPR0[®]

Form L-0500PL Rev. C

Installation, Operation, Repair and Parts Manual

Description

PowerLine Plus 2000 plunger pumps are designed for pumping water, soap, detergent, and other nonflammable liquids that are compatible with pump component materials. The maximum liquid temperature is 160° F for the PowerLine Plus 2200B-P, 2300B-P and 2400B-P model pumps.

Construction features include an oil-bath crankcase, a forged brass head, polished ceramic plungers and stainless steel unitized valves, (high-temperature, preloaded cup seals). Car wash pumps include high performance, low pressure seals for superior reliability in high vacuum applications. Heavy-duty, high pressure seals and back-up washers are included in all car wash pumps to guard against corrosion and continuous duty fatigue.

The 2200B-P and 2300B-P series have sturdy connecting rods/floating wrist pins (patent-pending). The crankshafts on all models are made of forged steel that is supported by extra heavy-duty bearings. The shaft rotation is in either direction.

Special corrosion-resistant cartridges are included specifically for car wash applications. Hypro's userfriendly oil-seal replacement cartridge technology on the 2200B-P, 2300B-P, 2350B-P, 2400B-P and 2430B-P models minimizes downtime.

POWERLINE PLUS 2200B-P

Duplex Plunger Pump

Flow Rate: 2.1 to 3.0 gpm Max. Pressure: 2000 psi (1725 rpm) 1500 psi (3450 rpm) RPM: 1725 & 3450 rpm

- Ports: 1/2" inlet 3/8" outlet
- Shaft: 3/4" dia. (solid) 5/8" dia. (hollow) 3/4" dia. (hollow)

POWERLINE PLUS 2300B-P and 2350B-P

Triplex Plunger Pump

Flow Rate: 3.1 to 4.8 gpm Max. Pressure: 2500 psi (2300) 3000 psi (2350) RPM: 1725 rpm Ports: 1/2" inlet 3/8" outlet Shaft: 3/4" dia. (solid) 3/4" dia. (hollow)

POWERLINE PLUS 2303B-P, 2304B-P & 2314B-P

Triplex Plunger Pump

Flow Rate: 3.1 to 4.2 gpm Max. Pressure: 1200 psi RPM: 1725 rpm (2303B-P & 2304B-P) 1450/1100 (2314B-P) Ports: 1/2" inlet 3/8" outlet Shaft: 3/4" dia. (solid)

POWERLINE PLUS 2400B-P and 2430B-P

Triplex Plunger Pump

Flow Rate: 4.3 to 7.9 gpm Max. Pressure: 2500 psi (2400) 3600 psi (2430) RPM: 1725 rpm Ports: 3/4" inlet 1/2" outlet Shaft: 1" dia. (solid)

Drive Source Installation

This manual covers the installation of the basic drive configurations available for Hypro's PowerLine Plus 2000 plunger pumps. Adapter kits, flange kits, and gearbox kits are covered in the installation instructions packed with the kit. Consult the recommendations of the manufacturer of your motor or engine for additional information. Read all safety information before attempting to install or operate the pump.

CARTRIDGE TECHNOLOGY

General Safety Information

California Proposition 65 Warning -- This product and related accessories contain chemicals known to the State of California to cause cancer, birth defects or other reproductive harm.

- 1. WARNING: Use a pressure relief device on the discharge side of the pump to prevent damage from pressure buildup when the pump discharge is blocked or otherwise closed and the power source is still running. For trigger gun operation, or where discharge is frequently shut off, pressure unloader valves are recommended. FAILURE TO FOLLOW THIS WARNING CAN RESULT IN PERSONAL INJURY AND/OR PROPERTY DAMAGE AND WILL VOID THE PRODUCT WARRANTY.
- WARNING: Do not pump flammable or explosive fluids such as gasoline, fuel oil, kerosene, etc. Do not use in explosive atmospheres. The pump should be used only with liquids that are compatible with the pump component materials. Failure to follow this warning can result in personal injury and/or property damage and will void the product warranty.
- 3. Do not run the pump faster than maximum recommended speed.
- 4. Do not pump at pressures higher than the maximum recommended pressure.
- The maximum liquid temperature is 160°F for PowerLine Plus 2200B-P, 2300B-P and 2400B-P models.
- 6. Make certain that the power source conforms to the requirements of your equipment.
- 7. Provide adequate protection in guarding around the moving parts such as the shaft and pulleys.
- 8. Disconnect the power before servicing.
- 9. Release all pressure within the system before servicing any component.
- 10. Drain all liquids from the system before servicing any component.

- 11. Secure the discharge lines before starting the pump. An unsecured line may whip, causing personal injury and/or property damage.
- 12. Check the hose for weak or worn condition before each use. Make certain that all connections are tight and secure.
- Periodically inspect the pump and the system components. Perform routine maintenance as required. (See Maintenance section.)

WARNING: RISK OF ELECTRIC SHOCK!

To reduce the risk of electric shock, adequately ground the electric motor to a grounded metal raceway system, or use a separate grounding wire that is connected to bare metal on the motor frame or to the grounding screw located inside motor terminal box; or ground by other suitable means. Refer to the most recent National Electric Code (NEC) Article 250 (Grounding) for additional information. ALL WIRING SHOULD BE PERFORMED BY A QUALIFIED ELECTRICIAN.

WARNING: Do not handle a pump or pump motor with wet hands or when standing on a wet/damp surface or in water.

14. Do not operate a gasoline engine in an enclosed area. Be sure the area is well ventilated.

WARNING: Gasoline is a highly combustible fuel. The improper use, handling, or storage of gasoline can be dangerous. Never touch or fill a hot engine.

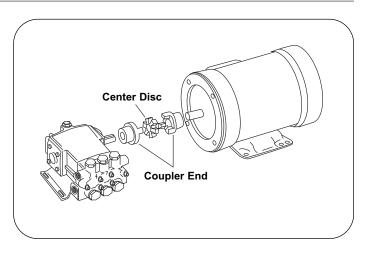

- 15. Use only pipe, hose and fittings rated for the maximum psi rating of the pump. If an unloader is used, then the pipe should be rated for pressure at which the unloader operates.
- 16. Do not use these pumps for pumping water or other liquids for human or animal consumption.

Direct Drive - Flexible Coupling Installation

To order the correct shaft couplers for your pump model, refer to Hypro Price List PL01.

- 1. Insert the keys onto the shafts and slide the coupler ends onto the pump and motor shafts flush with the shaft end.
- Mount the motor and pump onto the bases shimming the pump or motor so that the shafts are aligned. Make sure the shafts are aligned parallel. Leave enough space between the ends of the shaft to allow the coupler center disk to be inserted.
- 3. When the alignment is made, slide the coupler ends together over the coupler center disc.
- 4. Securely tighten the set screws in both coupler ends.

CAUTION: For safety, install a shield over rotating shafts and couplers.

Belt/Pulley Drive Installation

Belt and pulley drive systems are typically used to reduce pump speed. Pumps may be rotated in either direction allowing either clockwise (CW) or counterclockwise (CCW) operation of the motor or engine.

For determining proper pulley sizes, use the formula below as a guideline and use "A" or "B" section belts.

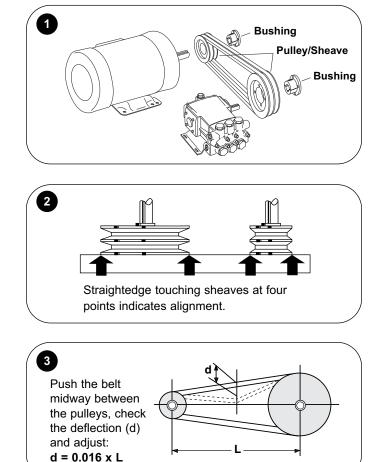

MOTOR RPM
PUMP RPMFLOW (@RATED SPEED)
FLOW (DESIRED)= PUMP PULLEY DIA.
MOTOR PULLEY DIA.

EXAMPLE: Use a 1725 rpm electric motor to drive a pump at 950 rpm.

Typically, a pulley diameter on the motor is 3.4 inches. The pump pulley diameter can be determined from the formula above:

1725 =	PUMP PULLEY DIAMETER
950	3.4 INCHES
<u>1725</u> x 3	3.4 INCHES = 6.2 INCHES
950	

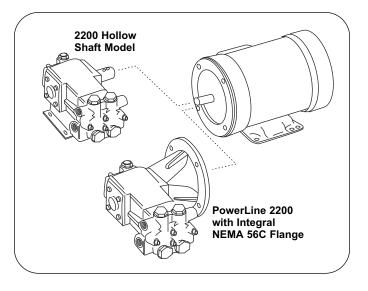

- Install the pulley or bushing/sheave combination (See Figure 1) onto the pump and motor shaft. Mount the pump next to the motor making sure the pulleys are lined up properly. Use a straightedge as shown in Figure 2. Rotate to check for run-out and bent shafts.
- Install belt(s) and use slots in the pump mounting rails to tighten the belts. Make sure the belts have proper tension. Belts that are too tight will cause bearing wear, and belts that are too loose will cause slipping. (See Figure 3.)

Direct Drive - Hollow Shaft and Integral C-Flange Installation

- 1. Position and mount the motor onto the base.
- 2. For hollow shaft models, install rubber grommets into the pump base, and install the pump base onto the pump securing with two 5/16" x 1/2" bolts.
- 3. Insert the key into the motor shaft keyway. Apply Never-Seize to the shaft and key.
- 4. Slide the pump onto the motor shaft. **DO NOT FORCE**; this prevents binding.
- 5. For integral C-flange models, line up the holes in the flange with the holes in the motor face and secure with four 3/8" x 7/8" hex head bolts.
- 6. Install set screws into the pump shaft and tighten securely.

Note: For hollow shaft models, the pump should not be mounted rigidly but should rest on the rubber grommets in the base to prevent rotation of the pump.

- 1. In general, select an adequate size drive unit to avoid overloading. Avoid unnecessary restrictions in the line such as elbows, check valves, and all extraneous curves and bends.
- 2. Avoid using a looped section which might permit air to become trapped.
- 3. Use pipe joint sealant on the pipe threads to assure airtight connections.
- 4. Selection of the right type and size of hose is vital to good performance. Be sure to hook the lines to the proper ports on the pump.
- 5. Always use genuine suction hose of at least the same diameter as the inlet port of the pump. If the suction (inlet) hose is more than four feet long, use the next larger size.
- 6. A strainer should be installed in the suction line (80 to 100 mesh is recommended). Clean the strainer as soon as it becomes clogged.
- 7. Use one or two braid reinforced hose to prevent collapse of suction line.
- 8. Use only approved, high-pressure hose on the discharge side, and make sure all connections are tight.

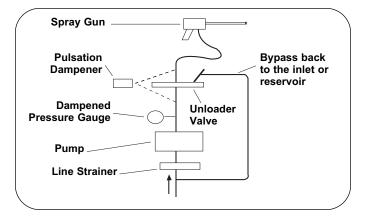

NOTE: Use only pipe, fittings, accessories, hose, etc. rated for the maximum pressure rating of the pump.

Pump

- 1. Before installing the pump, clean all fittings and hoses.
- 2. Rotate the pump by hand to make sure it turns freely.
- Make sure that all hose connections are tight and use the proper size fittings that are capable of safe operation.

CAUTION: Replace the oil plug with the dipstick before operating the pump.

IMPORTANT: Hypro PowerLine Plus pumps are filled with Hypro Oil. Hypro recommends changing oil after 40 hours of break-in operation and every three months or 500 hours, whichever comes first. Use Hypro Oil (P/N 2160-0038). Refer to the recommended lubrication marked on the crankcase of the pump.

Discharge Side Installation

From the pump to the discharge hose, the following accessories are recommended: a dampened pressure gauge with a face pressure double the maximum operating pressure, an unloader valve, a pulsation damper, an optional pressure gauge to monitor unloader, and discharge hose.

Accessories such as an unloader valve, a pressure gauge, a pulsation dampener - should be installed as close to the pump as possible. A hose must be used right after the accessories. If solid piping is used, a two to four foot section of hose must be installed between the accessories and the piping.

Inlet Side Installation

From the source of liquid to the pump, the following components are recommended: a shut-off valve, a bypass return tee from the unloader, a line strainer, and a compound pressure gauge.

Inlet Water Supply

Inlet Filter: Should be an 80-mesh screen. Hose: Pressure feed, 3/4" I.D. garden hose. Feed Requirement: 5 gpm — open. A garden hose should supply 10 gpm minimum (twice the pump requirement).

Operation

WARNING: DO NOT pump flammable or explosive liquids such as gasoline, kerosene, etc. DO NOT pump corrosive or abrasive liquids because these will cause rapid wear or deterioration of plungers, valves and seals in the pump. The pump should be used only with liquids compatible with pump component materials. Do not exceed the maximum specified rpm and pressure. Observe the lubrication instructions. Failure to follow this warning will void the product warranty.

Lubrication

Before running the pump, check the oil level using the

dipstick. Refer to the recommended lubrication marked on the crankcase of the pump.

The crankcase capacity is as follows: PowerLine Plus 2200B-P: 8 fl. oz., PowerLine Plus 2300B-P/2350B-P: 14 fl. oz., PowerLine Plus 2400B-P/2430B-P: 26 fl. oz., SAE 30 weight non-detergent. Change oil every 500 hours of operation.

Priming the Pump

To prime the pump, adjust the unloader valve to its lowest pressure setting. After starting the pump, open and close the gun to aid priming and to clear the valves of air. If the pump does not prime within a few seconds, stop the motor and inspect the installation for suction line leaks and obstructions. In general, keep suction lift to a minimum and avoid unnecessary bends in the suction line. The unloader valve must be readjusted after the prime has been obtained.

Care of the Pump

Generally, after each use, flush the pump with a neutralizing solution for the liquid pumped. Follow with a clear water rinse. For storage under freezing conditions, flush the pump with a 50% mixture of automotive antifreeze and water.

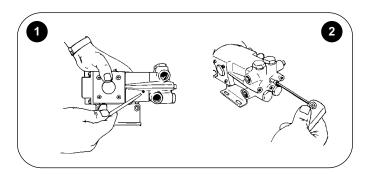

Plunger Seal Repair Models 2200B-P, 2300B-P and 2350B-P

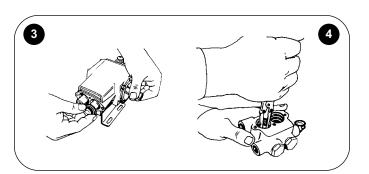

Tools Required

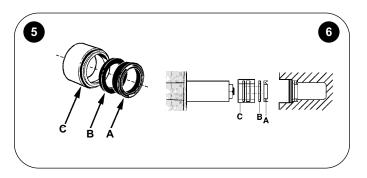

- 3/16" Allen Wrench
- External Pliers (P/N 3010-0057)
- 1. Replace the plunger seals if there is water leakage from the weephole (Figure 1).
- Use a 3/16" Allen wrench to remove the cylinder head bolts. Remove the head from the crankcase assembly (Figure 2).
- 3. After removing the head, rotate the shaft and remove the cup retainers from the plungers (Figure 3).
- Remove the cup retainer and the cup from the cylinder head. If they can't be removed by hand, use an external pliers (Figure 4).
- 5. Replace the plunger seal kits. Refer to the parts lists for the proper kit for your pump model.
- 6. Install the parts as follows:
 - a. With the groove facing down into the cylinder head, install the high pressure cup (Figure 6, Ref. A).
 - b. Install the Teflon support ring over the cup (Ref. B).
 - c. Install the plunger seal kits into the head as shown in Ref. C.
- 7. Turn the crankshaft so the plungers are even. With the outlet valve plugs up, install the cylinder head onto the crankcase body (Figure 7).
- 8. The capscrews should be torqued at 105-115 in. lbs. If a torque wrench is not available, tighten the capscrews down, but do not over tighten. Use a rotating procedure as shown (Figure 8). Remember to include the lock washers under the capscrews.

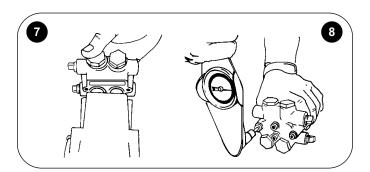

Valve Assembly Replacement - ALL Models

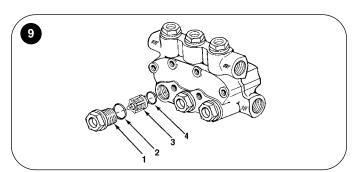

- 1. Remove the valve cap (Figure 9, Ref. 1).
- 2. With a needle nose pliers, remove the valve assembly (Ref. 3) from the head.
- 3. Remove the o-ring (Ref. 4) from below the valve assembly.
- 4. Remove the o-ring (Ref. 2) from the valve cap.
- 5. To reassemble, reverse the above steps.
- Torque specifications on the valve cap:
 60 ft. lbs. on the 2200B-P and 2300B-P series.

Packing Replacement Models 2400B-P and 2430B-P

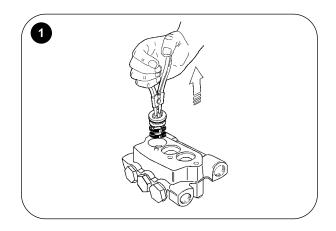

- With a 1/4" Allen wrench, remove six head bolts. Turn the shaft to push the head from the crankcase assembly, then pull the head off the plungers.
- Remove the cup retainer assembly from the cylinder head. These can usually be removed with a finger. If they cannot be removed by hand, use an external pliers to remove the assemblies from the head (Figure 1). (It may be helpful to place a screwdriver between the pliers jaws.)

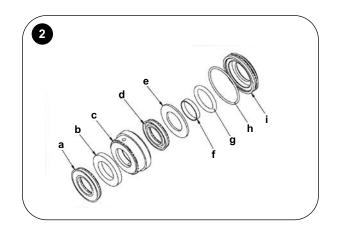

Next, remove the Teflon backup ring and the high pressure cup from the head.

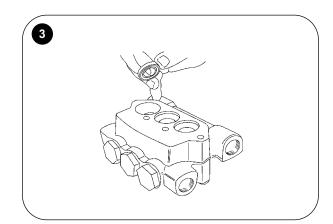

- 3. Remove the low pressure seal from the cup retainer with a small flat-blade screwdriver. The o-ring around the outside of the cup retainer can also be removed with a small screwdriver or knife.
- 4. Remove the vacuum rings by rotating the crankshaft. Remove the retainers from the oil seal retainer.
- 5. If you are replacing oil seals at this time, see the oil seal replacement section.
- 6. The parts to be replaced consist of three high pressure cups, three backup rings, three low pressure cups, three vacuum seal rings and six o-rings found in the seal repair kit. Refer to the parts list for the proper parts kit. The parts shown in Figure 2 are as follows:

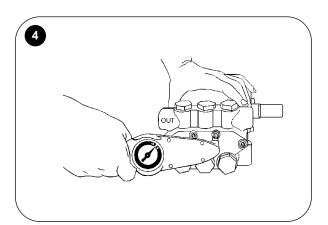

(a) high pressure cup, (b) backup ring, (c) brass cup retainer, (d) low pressure cup, (e) low pressure cup retainer, (f) vacuum seal ring, (g) vacuum o-ring, (h) o-ring, vacuum seal retainer, (i) vacuum seal retainer.

- Install the parts into the head as follows: (Figures 2 and 3)
 - 7.1 Install the high pressure cup with the groove facing down into the cylinder head.
 - 7.2 Install the backup ring over the high pressure cup.
 - 7.3 Install the brass cup retainer with the narrow end facing down into the cylinder head.
 - 7.4 Install the low pressure cup into the cup retainer.
 - 7.5 Install the low pressure cup retainer into the head.
 - 7.6 Press the vacuum seal ring into the o-ring. With the two parts together, push them into the vacuum seal retainer.
 - 7.7 Place the o-ring (h) over vacuum seal retainer.
 - 7.8 Install the vacuum seal with the retainer and retainer ring, over the plunger and into the oil seal retainer.
- 8. Install the cylinder head onto the plungers with the outlet ports on top. Secure to the crankcase with the head bolts torqued to 170 inch lbs. (Figure 4).
- 9. Turn the pump shaft to make sure there is no binding.

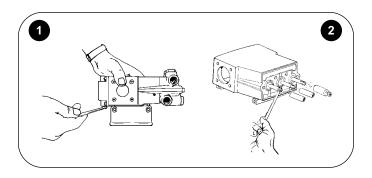

Oil Seal Replacement 2200B-P and 2300B-P Series

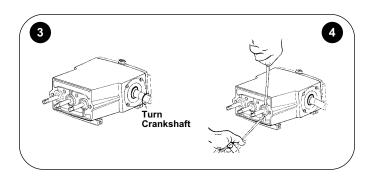

Tools Required

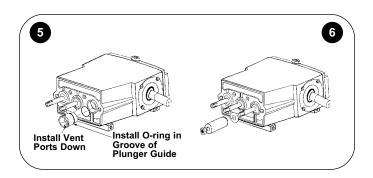

- Oil seal insertion tool P/N 3010-0248 (Models 2200B-P thru 2350B-P)
- 9/16" hex wrench
- 3/16" flat screwdrivers
- 1. Drain the oil from the crankcase using a 9/16" hex wrench (Figure 1).
- 2. Remove the cylinder head, then remove the plunger retaining nuts with a 9/16" hex wrench. Remove the plungers and slinger rings (Figure 2).
- 3. Inspect the plunger rods for nicks or scratches. Turn the crankshaft, and at the same time, note the condition of the rods (Figure 3). Replace the rods if nicks or scratches are present. The oil seal will not work if the plunger rods are damaged. (Remove the back cover to replace plunger rods). CAUTION: The needle bearings have loose needles. Repack the needles with grease to hold in place if the shaft is removed.
- Lift out the plunger guide using two flat screwdrivers. Be careful not to damage the plunger rods (Figure 4).
- Replace the plunger guides with oil seals and o-rings by indexing to the vent ports as shown (Figure 5). Refer to the parts list for the proper oil seal repair kit for your model of pump.
- Reinstall the slinger rings and ceramic plungers (Figure 6); torque the retaining nut to 105-115 in. lbs. Use Locktite 242 on all plungers and nuts. Reinstall the cylinder head. Check to see that the crankshaft turns freely.
- Install the oil plug. Fill the crankcase to the correct oil level on the dipstick. Refer to the recommended lubrication marked on the crankcase of the pump. Use 8 oz. for 2200 models; 14 oz. for 2300 models.

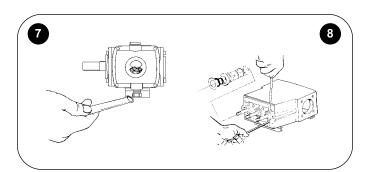

Oil Seal Replacement Series 2400B-P and 2430B-P

- 1. See the packing replacement instructions for head removal.
- 2. Remove the plunger nut, plunger and slinger ring.
- Lift the oil seal retainer cartridge from the crankcase. A 90°Allen wrench or bent bar may be used to pry the retainer out. The slot under each plunger may be used to access the cartridge (Figure 8).
- 4. Push the old oil seal out and remove the o-ring from the outside of the cartridge.
- 5. Install the new oil seal into the cartridge placing the flat surface in first. Replace the o-ring on the outside of the cartridge. Lightly oil the o-ring and cartridge to prevent damage during installation.
- 6. Push the retainer containing the o-ring and oil seal into the crankcase. Align the holes in the cartridge with the slots in the crankcase.
- Replace the plunger as described in the plunger replacement section. Replace the head as described in Step 8 of the packing replacement section.

Plunger Replacement

- 1. Remove the pump head from the crankcase as described earlier in the packing replacement section.
- 2. Remove the plunger retaining nut and carefully slide the plunger off of the lower plunger. Remove the oring from the lower plunger. Remove the plunger retaining nut and slinger ring.
- 3. Inspect the plungers for cracking or damage, and replace if damaged. Always replace the slinger ring when a ceramic plunger is removed. This avoids fracturing the plunger when torquing the plunger retaining nut. Use Locktite 242 on the plunger nut. See the parts list for proper plunger kits.

- 4. Install new parts as follows:
 - a. Install the slinger ring onto lower plunger.
 - b. Lightly oil the lower plunger rod and install the o-ring backup seal into place.
 - c. Slide the plunger onto the lower plunger placing the end of the plunger containing the black ring towards the crankcase.
 - d. Install the plunger retaining nut washer and retaining nut onto the lower plunger. Torque the plunger nut with Locktite 271 to 100-115 in. lbs. for all models.
- 5. Install the new plunger packings as described in the packing replacement section.

Model 8000-0015 and 8000-0021 Gearbox Kits Installation

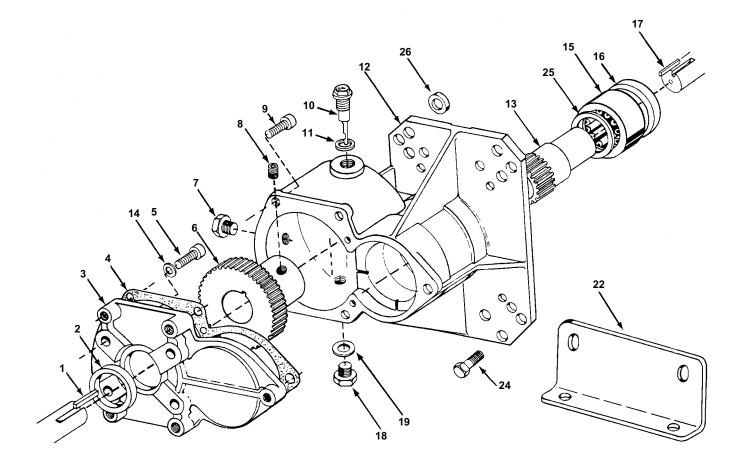

See the gearbox illustration and parts breakdown on Page 9.

- 1. Remove four 5/6" x 3/4" Allen head capscrews from the pump end cover on the shaft side of the pump with a 1/4" allen wrench.
- Install the oil seal lip in the gearbox cover (Ref. 3). Install the gearbox cover over the pump shaft and align the holes. Put four copper washers (Ref. 14) onto four 5/16 x 1-1/4" Allen head bolts (Ref. 5) and apply two drops of Loctite (supplied) onto threads. Secure the gearbox cover to the pump with the bolts. (Torque to 150 in. lbs.)
- 3. Install the gasket (Ref. 4) onto the cover and align the gasket using the two dowel pins in the cover.
- 4. Insert the 1-1/4" key into the pump shaft keyway. Slide the driven gear (Ref. 6) onto the pump shaft with the gear teeth towards the pump. Slide the gear until it butts up against the shoulder on the pump shaft. Secure the gear with two set screws using a 5/32" Allen wrench.
- Place the gearbox body (Ref. 12) onto the gearbox cover, again using the dowel pins as an alignment guide. Secure the gearbox body with five 5/6" x 1" Allen head capscrews (Ref. 9) using a 1/4" Allen wrench to tighten securely. (Torque to 150 in. lbs.)

- Install the pump support bracket (Ref. 22) onto pump on opposite side from the gearbox. Secure with two 3/4" hex head bolts (supplied with pump) and tighten with 9/16" box end wrench.
- Insert the 3-1/4" key for Model 8000-0015 or 2-1/2" key for Model 8000-0021 into the gas engine shaft keyway. Apply Never Seize to the gas engine shaft and the inside of the driver gear.
- 8. Install the pump/gearbox assembly onto the gas engine shaft and secure with four hex head bolts and tighten securely with a 5/8" open end wrench for Model 8000-0015 and a 1/2" wrench for Model 8000-0021. Failure to follow this procedure will result in seal damage.
- 9. Secure the pump support bracket to the base.
- 10. Remove the plug (Ref. 7) from overfill hole and dipstick (Ref. 10) and fill the gearbox with 90 weight gearlube until it pours out the overflow hole. Reinstall the plug and dipstick.
- 11. Make sure the pump is filled with 26 oz. of Hypro Oil. Refer to the recommended lubrication marked on the crankcase of the pump.

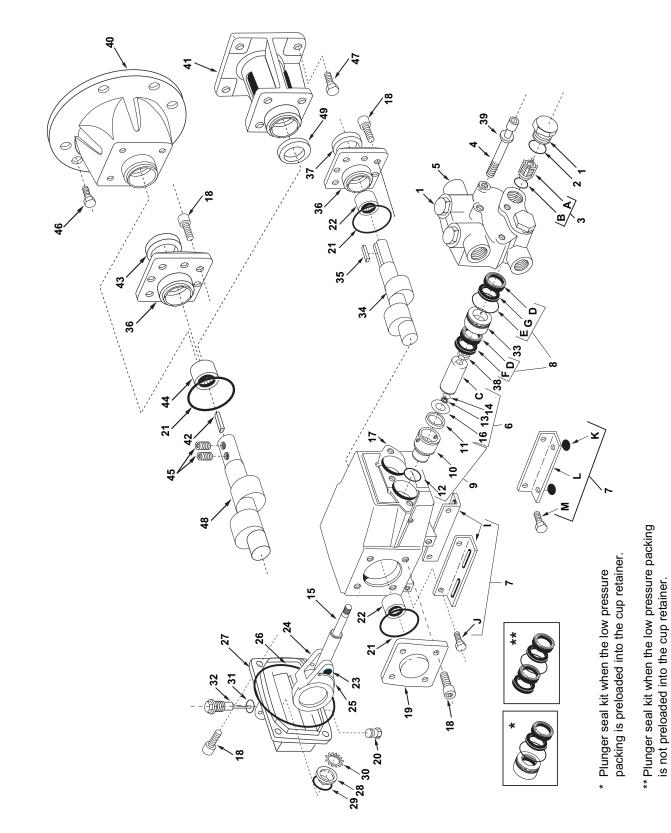

Unloader Valve Safety Information

- 1. Always size your unloader valve to match the capabilities of your system for pressure (psi) and volume (gpm).
- In rigid-piped systems, a pulsation dampener or accumulator MUST be installed in the system. Select a dampener which conforms to the rated capacity.
- 3. Never replace the main spring with one of heavier tension to increase pressure. Never add washers to increase spring tension.
- 4. Always replace safety shields caps.
- 5. Secure all locking devices to eliminate the unloader from vibrating out of adjustment during operation.

Hazardous Substance Alert

- 1. Always drain and flush pumps before servicing or disassembling for any reason (see instructions).
- 2. Always drain and flush pumps prior to returning the units for repair.
- 3. Never store pumps containing hazardous chemicals.
- 4. Before returning a pump for service/repair, drain out all liquids and flush the unit with a neutralizing liquid. Then, drain the pump. Attach a tag or include a written notice certifying that this has been done. Please note that it is illegal to ship or transport any hazardous chemicals without United States Environmental Protection Agency Licensing.

			Troubleshootir	ng				
Symptom	1	Probable (Cause(s)	Corre	ctive Action			
Pump runs but p	roduces no flow.	Pump is not	primed.	Flood suction, th	en restart pump.			
Pump fails to pri	me.	Air is trappe	d inside pump.	Flood suction ho	harge hose from pump. se, restart pump, and run has been evacuated.			
Pump loses prim Chattering noise pressure fluctuat	,	Air leak in s inlet fittings.	uction hose or	leaks by pressur	hose and test for izing hose with water. d sealant has been used on			
		Suction line collapsed or	,	Remove suction line and inspect it for a loose liner or debris lodged in hose. Avoid all unnecessary bends. Do not kink hose.				
		Clogged suc	ction strainer.	Clean strainer.				
Low pressure at	nozzle.	Unloader va	lve is bypassing.	Make sure unloa bypass seat is ne	der is adjusted properly and ot leaking.			
		Incorrect or	worn nozzle.		e is matched to the flow and pump. If the nozzle is			
		Restricted in	ntake.	Refer to above p	riming information.			
Pressure loss in	general.	Screen clog	ged.	Check the scree replace.	n for debris and clean or			
		Inlet size to	o small.	Make sure it is b	ig enough.			
		Worn or clo stuck due to	gged valves are o rust.	Inspect valves for debris and replace	or rust, wear, pitting and ce if necessary.			
		Unloader by	passing.	Plumbed wrong. out of the bypass	See if the flow is diverting s line.			
		System leak	(S.	Check for leaks.				
Note: Cavitat	ion Will Dama	ae Your Pu	Inst	all a fitting at the suc	tion side so you can check			

Note: Cavitation Will Damage Your Pump! Cavitation occurs when an inadequate amount of fluid is available for feeding the pump.

To check for possible cavitation:

• Test the water flow that will feed the pump by filling a one or five-gallon container and timing how long it takes to fill the vessel; i.e. if your unit requires 3 gallons per minute to satisfy the specifications, your water supply (free flow) should exceed 3 gpm, and preferably 1.5 to 2 times the required flow.

If it takes the supply water noticeably longer to fill the test container to the gallons per minute that your system requires, your pump could be experiencing cavitation. Cavitation can severely damage seals, pistons and valves and will shorten the life of all components in the hydraulic system.

To Avoid Cavitation:

- Keep the size of the suction line as large as possible, preferably the same size (or larger) as the inlet port.
- Use high-capacity, clean line strainers.

- all a fitting at the suction side so yo the vacuum periodically. The vacuum should not exceed 2-3 inches of Hg to obtain the best operation.
- Protect the pump from overheating.
 - Protect it from direct sunlight in hot weather.
 - o Maintain adequate ventilation.
 - Keep lubricating fluids clean and at full levels.
- · Protect the pump from severe cold by covering or operating indoors.
- Make sure the pump is secure and can't move around.
- Control the pressure with unloader valves and balanced relief valves. To prevent pressure spikes, don't over tighten the control valves.
- · Use a pulsation dampener. Soft hose works well.
- To avoid vacuum leak, prevent the system from flowing against gravity.
- In a gravity-fed system, keep the rate of flow from ٠ gravity the same (or more) as the feed requirements of the pump.

Limited Warranty on Hypro PowerLine Plus 2000 Plunger Pumps

Hypro warrants to the original purchaser of its products (the "Purchaser") that oil crankcase plunger pumps will be free from defects in material and workmanship under normal use for the period of five (5) years, and accessories will be free from defects in material and workmanship under normal use for the period of ninety (90) days. In addition, Hypro warrants to the purchaser all forged brass pump manifolds will be free from defects in material and workmanship under normal use for the period of the purchaser and workmanship under normal use for the period of ninety (90) days. In addition, Hypro warrants to the purchaser all forged brass pump manifolds will be free from defects in material and workmanship under normal use and from damage resulting from environmental conditions for the life of the pump.

"Normal use" does not include use in excess of recommended maximum speeds, pressures, vacuums and temperatures, or use requiring handling of fluids not compatible with component materials, as noted in Hypro product catalogs, technical literature, and instructions. This warranty does not cover freight damage, freezing damage, normal wear and tear, or damage caused by misapplication, fault, negligence, alterations, or repair that affects the performance or reliability of the product.

THIS WARRANTY IS EXCLUSIVE. HYPRO MAKES NO OTHER WARRANTY, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Hypro's obligation under this warranty is, at Hypro's option, to either repair or replace the product upon return of the entire product to the Hypro factory in accordance with the return procedures set forth below. THIS IS THE EXCLUSIVE REMEDY FOR ANY BREACH OF WARRANTY.

IN NO EVENT SHALL HYPRO BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES OF ANY KIND, WHETHER FOR BREACH OF ANY WARRANTY, FOR NEGLIGENCE, ON THE BASIS OF STRICT LIABILITY, OR OTHERWISE.

Return Procedures

All pumps or products must be flushed of any chemical (ref. OSHA Section 0910.1200 (d)(e)(f)(g)(h)) and hazardous chemicals must be labeled before being shipped* to Hypro for service or warranty consideration. Hypro reserves the right to request a Material Safety Data sheet from the Purchaser for any pump or product Hypro deems necessary. Hypro reserves the right to "disposition as scrap" pumps or products returned which contain unknown substances, or to charge for any and all costs incurred for chemical testing and proper disposal of components containing unknown substances. Hypro requests this in order to protect the environment and personnel from the hazards of handling unknown substances.

For technical or application assistance, call the **Hypro Technical/Application number: 800-445-8360**, or send an email to: **technical@hypropumps.com**. To obtain service or warranty assistance, call the **Hypro Service and Warranty number**: **800-468-3428**; or send a fax to the **Hypro Service and Warranty FAX**: **651-766-6618**. Be prepared to give Hypro full details of the problem, including the following information:

- 1. Model number and the date and from whom you purchased your pump.
- 2. A brief description of the pump problem, including the following:
 - Liquid pumped. State the pH and any non-soluble materials, and give the generic or trade name.
- Drive type (gas engine/electric motor, direct/belt drive, tractor PTO) and rpm of pump.
- Temperature of the liquid and ambient environment.Suction lift or vacuum (measured at the pump).
- Viscosity (of oil, or other than water weight liquid).
 Elevation from the pump to the discharge point.

- Discharge pressure.
- Size, type, and mesh of the suction strainer.
- Size and material of suction and discharge line.
- Type of spray gun, orifice size, unloader/relief valve.

Hypro may request additional information and may require a sketch to illustrate the problem. Contact the factory to receive a return material authorization before sending the product. All pumps returned for warranty work should be sent shipping charges prepaid to: HYPRO / PENTAIR
